

ABSTRACT OF THE DISCLOSURE

This invention is an electronically sanitized medical glove dispensing machine. Not only does the machine place the warm gloves on your hands, it also takes them off and disposes of them in a sanitary way, such as a biohazard bag. The apparatus works via a compressor and a circuit board, along with sensors, "gripper clips", small air hoses, latex gloves, and a stainless steel housing. The sanitized glove is inflated so the hand can be placed in the glove before usage. A hook grips the gloves after the medical worker is finished with them, removes them, and sanitizes them.
